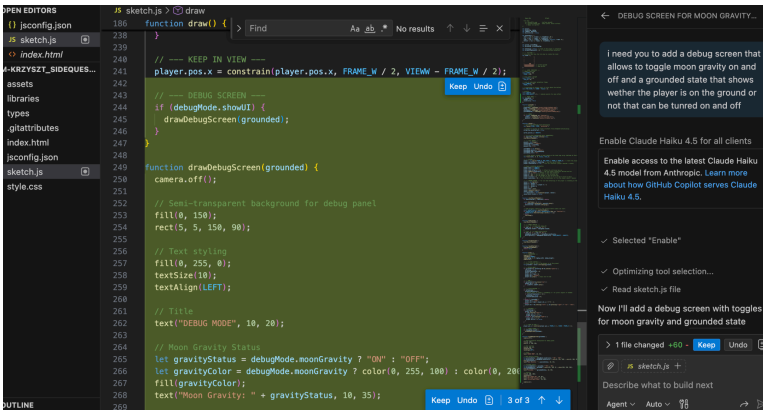
Process & Decision Documentation

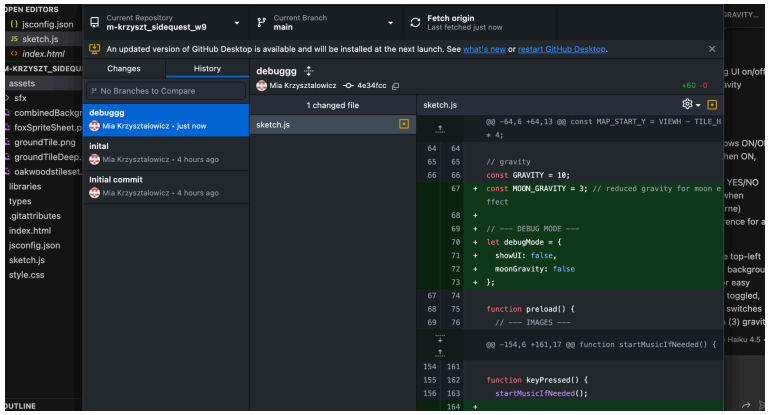
Side Quests

Focus on:

One significant decision or change you made? Why you made it? What effect it had on the project?

I added a debug screen with toggles for moon gravity and a grounded state display so I could test player physics more efficiently without constantly editing the code. This decision made it easier to quickly switch between normal and reduced gravity and visually confirm whether the player was on the ground, which improved debugging speed and helped ensure the movement mechanics worked correctly.





GenAI Documentation

Date Used: Mar/21/2026

Tool Disclosure: GitHub Copilot in visual studio code

Purpose of Use: Debugging and code structure

Summary of Interaction:

Requested a debug with toggles for moon gravity and grounded state. Copilot analyzed the file and added variables, controls, and an on-screen debug panel

Human Decision Point(s):

I Choose what features to include as the extra de-bug grounded state and how they should behave in gameplay.

Integrity & Verification Note:

I reviewed and tested the code to ensure toggles worked correctly and did not break movement or physics.

Scope of GenAI Use:
Assisted with implementation and structure, core ideas and requirements were defined by me.

Limitations or Misfires:
Minor adjustments may be needed for styling or exact behavior, but overall code ran accurately.

Summary of Process (Human + Tool)
I defined features as Copilot generated implementation. I reviewed and tested the final adjustments.

Verification & Judgement
Confirmed functionality through gameplay testing (toggling gravity and checking grounded state display).
